; Sequence 3, Application US/09791118A
; Sequence 3, Application US/09791118A
; Patent No. US20020034741A1
; GENERAL INFORMATION:
APPLICANT: Braun, Susanne
; APPLICANT: Pentaberg, Jorn-Peter
APPLICANT: Regenbogen, Johannes
; TITLE OF INVENTION: Use of polypeptides or nucleic acids
TITLE OF INVENTION: Use of polypeptides or nucleic acids
TITLE OF INVENTION: Leatment of skin or intestinal disorders,
TITLE OF INVENTION: the identification of pharmacologically
TITLE OF INVENTION: active substances
; TITLE OF INVENTION: DATE: 2001-02-22
; CURRENT APPLICATION NUMBER: US/09/791,118A
; CURRENT FILING DATE: 2000-04-24
; PRIOR FILING DATE: 2000-04-24
; PRIOR FILING DATE: 2000-04-23
; NUMBER OF SEQ ID NOS: 26
; SOFTWARE: FastSEQ for Windows Version 4.0

and for diagnosis, prevention, and in screening for for Use of NM23 polypeptide and nucleic acid, f treatment of skin and intestinal diseases, therapeutic agents.

48pp; German. Claim 1; Page 21-22; This invention describes a novel use of the NM23 protein family, for analysis, diagnosis, prevention and/or treatment of skin or intestinal diseases and/or wound healing and/or associated pathological disturbances. The products of the invention have vulnerary, antitumour, gastrointestinal, dermatological, anti-inflammatory and antiulcer activity. The NM23 protein family act as nucleotide-diphosphate kinases, activity, The NM23 protein family act as nucleotide-diphosphate kinases, buA-binding and transcription activating agents and regulators of Ras-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
       ected against transformed
GTPases. The proteins of the invention, antibodies (Ab) directed against them, and their encoding nucleic acids, or related vectors, transformed cells and antisense sequences, are used for analysis, diagnosis, prevention and/or treatment of skin and intestinal diseases (where associated with uncontrolled tissue growth or cell differentiation, particularly skin and intestinal tumours, also psoriasis, Crohn's diseas and ulcers), wound healing and/or associated pathological alterations). They are also used to screen for agents that are potentially useful for treating these conditions. In vitro monitoring of NM23 protein expression in tissue samples provides an early diagnosis of disease. This sequence represents the murine NM23A protein described in the method of the

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication

The invention relates to novel isolated lung small cell cancer antigen polynucleotides (I) and polypeptides (II) used in a method of detecting cancer in a patient. The method is optionally performed by utilising cancer in a patient. The method is optionally performed by utilising oligonucleotides (III), where the biological sample from the patient is contacted with (III), detecting the amount of polynucleotide hybridised to (III) in the sample and comparing the amount of polynucleotide to a predetermined cut-off value and thereby determining cancer in a patient.

(I), (II) or antigen-presenting cells expressing (II) is useful for atimulating and/or expanding T cells with one of the components under conditions to permit the stimulation and/or expansion of the cells. A conditions to permit the stimulation and/or expansion of the cells. A conditions to patient. An isolated T cell population is useful for removing tumour cells from the biological sample and for inhibiting the development of a cancer especially cremoving tumour cells from the biological sample and for inhibiting the development of cancer in a patient. And isolated T cell population is useful for removing tumour cells from the biological sample and for inhibiting the development of cancer in a patient. Add(9407-AAU(9431 represent novel human lung small cell cancer antigen amino acid sequences of the

                                                                                                                                                                                                                                                                           122
                                                                                                                                                                                                                                                                                                  136
                                                                        The invention relates to novel biomarkers for liver diseases. The invention also relates to the use of an autoantigen screening method to identify biomarkers that can be used in detecting liver diseases such as liver cirrhosis and liver cancer. The present sequence is the human NM23 protein. This sequence is the autoantigen identified from cell lines using sera of patients with liver cirrhosis and liver cancer.
                                                                                                                                                                                                                              62

The present invention provides a method for analyzing differential protein expression associated with histopathological features of breast disease, in particular breast tumors, e.g. breast carcinomas, comprising detecting the overexpression or underexpression of a pool of proteins in breast tissues or cells. The pool comprises all or part of a protein set comprising: afadin, aurora A, alpha-catenin, beta-catenin, BCL2, cyclin C, cyclin E, cytokeratin S, all B. B. Cadherin, BGRR, ERBB2, ERBB3, ERBB3, ERBB3, ERBB3, estrogen receptor, FGRR1, FHTT, GARC3, cytokeratin G, cytokeratin B, angl, aurora B, BCRP1, cathepsin D, CD10, CD44, CK14, cox2, fibroblast growth factor 2 (FGF2), GATA4, hifla, matrix Gers, posterin, PLAU, S100, SCRIBBEB, smooth muscle actin, thrombospondin (THBS) 1, tissue-inhibitors of matrix metalloprotease (MMP) 9, MTA1, NM23, neuregulins (RRG) 1 alpha, NRG1 beta, p27, parkin, PLAU, S100, SCRIBBEB, smooth muscle actin, thrombospondin (THBS) 1, tissue-inhibitors of matrix metalloprotease 1 (TMMP). The measuring of over- or underexpression of proteins is carried out on tissue microarray, by immunohistochemistry (IHC) technologies. The method may involve comparing expression levels of the protein set in a control sample to levels of equivalent proteins in a tissue sample. The detection may also involve detecting the over- or underexpression of nucleic acids coding for the proteins. Also claimed are a protein library and a nucleic acid library useful for the molecular characterization of histopathological features of breast disease. The method is useful for analyzing differential protein expression associated with breast cancer, predicting claimed associated with breast cancer, predicting a predicting of breast cancer, predicting of breast cancer. Teratment of a patient can be based on the analysis of the protein of a patient can be based on the analysis of the protein of a patient can be besed on the method is a breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               erapy can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              a patient can be based on the analysis of the differential protes expression profile. Breast cancers can be classified into prognos relevant subclasses, and appropriate doses and/or schedule of chemotherapeutics and/or biopharmaceuticals and/or radiation them be selected to circumvent toxicities in a patient. The method is useful in assessing breast cancer heterogeneity and prognosis in with stage I, II or III disease. The present sequence is that of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                OPAVKPCHLKGTMANSERTFIAIKPDGVQRGLVGEIIKRFEQKGFRLVGLKFLQA

```
The present sequence is the human nm23 protein nm23-H1, the gene for which is found on chromosome 17q21. Its coding sequence was isolated by searching a human fibroblast cDNA library for sequences similar to pnm23-M1. Nm23 proteins are involved in tumour metastasis, and this protein, its gene and antibodies can be used to determine an individual's susceptibility to cancer and the likelihood of tumour metastasis within that individual. This is possible using a number of methods, including Northern blotting, nuclease protection assays, in situ hybridisation, immunohistochemical analysis and solid phase immunoassays
                                                                                                                                                                                                                       useful
                                                                                                                                                                                                                       New nm23 monoclonal antibody which recognizes human nm23 protein, usefu
for detecting tumors which have low levels of nm23 protein and thus an
increased ability to metastasize or be malignant.

                                                                                                             the
                                                                                                                                                                   The invention relates to an isolated polynucleotide molecule encoding a human nm23 protein comprising nm23-H1 having a sequence of 746 base pai (bp) fully defined in the specification or nm23-H2S having a sequence of 670 bp fully defined in the specification. The polynucleotide molecule the invention is useful as a diagnostic tool for detecting and/or determining RNA or DNA which can be employed to detect mRNA expression cancer cells to aid in predicting the malignant potential of a human tumour. The DNA and the antibodies may also be used to detect abnormalities of DNAs in normal or cancer cells to aid in predicting the genetic predisposition for developing cancer. The human nm23 protein cabe employed to produce nm23 antibodies. This sequence represents the nm-H1 protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                 IRGDE

The sequences given in AAG79335-38 show the related human proteins NM23-H1 had H2S. These proteins are products of different genes, with NM23-H1 being localised to chromosome 17. These proteins are used to predict aggressiveness (metastatic potential) of human tumours and in genetic tests for cancer susceptibility, diagnosis and prognosis, also for selection of treatment, e.g. susceptibility to early-onset familial breast cancer. Gene nm23 may contribute to tumourigenicity and alteration in its regulation may be an early stage in the metastatic cascade.

This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer. Or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection brostatic tissue. Screening for inhibitors of the sequences or detection cubstances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonuclectides, with tumour cells. Inhibitors can be chosen from antisense oligonuclectides, ending the below 5000, preferably 300, that binds to the polypeptide; weight below 5000, preferably humanised or human; an anti-idotype, non-human conjugated below 5000, preferably humanised or human; an anti-idotype, non-human conclonal) antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or andocional) antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or cancer by differential expression analysis, using by differential expression analysis, using DNA microarrays, between normal and tumorous tissues, with (over)expression being detected sequentially with anti-human CD4 murine monoclonal antibodies; by quantitative PCR. Analysis of prostatic cancer samples showed that CD24 was upregulated in many of them. Sections of sequentially with anti-human CD4 murine monoclonal antibodies; conterpationed with hemalum (blue). Malignant cells stained sequence and cytoplasmic staining was very strong, and lymph node metastases were also stained. ADR65805-ADR66954 represent the incorporation and polympetide sequences used in the metastases the prostatic ander pariety of the prostatic ander pariety of the prost
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ë

This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer. Cor the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection substances involves a binding assay, any compounds that bind are celected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, short-interfering RNA or ribozymes; an organic molecule of molecular weight below 5000, preferably 300, that binds to the polypeptide; an aptamer against the polypeptide; a (monoclonal) antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polynucleotides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays. between normal and tumorous tissues, with (over)expression being detected by quantitative PCR. Analysis of prostatic cancer samples showed that CD24 was upregulated in many of them. Sections of tissue, isolated from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 against the

prostatic cancer patients, or subjects at risk, were incubated sequentially with anti-human CD4 murine monoclonal antibodies; biotinylated second antibody; streptavidin-conjugated horseradish peroxidase and then diaminobenzidine as colour former (brown). The samples were counterstained with hemalum (blue). Malignant cells stained strongly but non-malignant cells only weakly. In 15 of 63 samples of adenocarcinoma, membrane and cytoplasmic staining was very strong, and lymph node metastases were also stained. ADR65805-ADR66954 represent the polynucleotide and polypeptide sequences used in the method of the
                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                            73
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   paralysis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to nucleoside diphosphate kinase 19.47 (ABB99909) and nucleic acids encoding it (ABQ77987). The protein has a molecular weight of 19.47 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications Nucleoside diphosphate kinase 19.47 can be used in the treatment of a variety of diseases such as tumours, embryonic development disorders and

carcinoma; human; neuroblastoma.

```
The present sequence represents human nm23-H1 protein. The specification describes a method for the diagnosis of metastatic potential of a carcinoma in a patient. The method comprises obtaining a sample of chromosomal DNA from the tumour of the subject, and analysing the sample of chromosomal DNA for the presence or absence of a human nm23-H1 allele. The absence of a human nm23-H1 allele indicates metastatic potential. The subject has previously had or currently has breast carcinoma, non-small cell lung carcinoma or kidney carcinoma. The metastatic potential is due to allelic deletions in the human nm23 gene, nm23-H1. The method can also be used for the diagnosis of colorectal carcinoma or neuroblastoma in patients who have had or currently have such carcinomas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FTGLVKYMHSGPVVAMVWEGLNVVKTGRVMLGETNPADSKPGTIRGDFCIQVGRNIIHGS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA encoding this human nm23 protein is useful for detecting mRNA expression in cancer cells and for helping predict the malignant potential of a human tumour. This nm23 protein is useful for raising antibodies for detecting tumours having low levels of nm23 protein and thus an increased ability to undergo metastasis or be malignant. See ala AAQ11721

These proteins are products of different genes, with NM23-H1 being localised to chromosome 17. These proteins are used to predict aggressiveness (metastatic potential) of human tumours and in genetic tests for cancer susceptibility, diagnosis and prognosis, also for selection of treatment, e.g. susceptibility to early-onset familial breast cancer. Gene nm23 may contribute to tumourigenicity and alteration in its regulation may be an early stage in the metastatic cascade. Allelic or homozygous deletion of the gene is detected in some primary tumour cells

NiAlternate names: protein F25124.220; protein F8M12.12
C; Species: Arabidopsis thaliana (mouse-ear cress)
C; Date: 26-Feb-1999 #sequence_revision 26-Feb-1999 #text_change 09-Jul-20
C; Accession: T01877; T04296
R; Madsen, C.; Graves, T.; Cotton, M.; Modde, T.
Submitted to the EMBL Data Library, July 1998
A; Description: The sequence of A. thaliana F8M12.
A; Reference number: Z14450
A; Accession: T01877
A; Reference number: Z14450
A; Accession: T01877
A; Reference Lype: DNA
A; Residues: 1-238 <AMAD>
A; Residues: 1-238 <AMAD>
A; Experimental source: cultivar Columbia
R; Bevan, M.; Hilbert, H.; Braun, M.; Holzer, E.; Brandt, A.; Duesterhoeft submitted to the Protein Sequence Database, March 1999
A; Reference number: Z15261
